1 INTRODUCTION

1.1 BACKGROUND

A Limited Phase II Environmental Site Assessment (ESA) was requested by Reich Brothers Holdings, LLC (Reich Brothers, the “Client”) to further assess recognized environmental conditions (RECs) at the former EMS Beaumont Facility (Site) located at 17691 State Highway 124, Beaumont, Jefferson County, Texas. The subject property comprises approximately 7.27 acres of land and is surrounded by residential properties. The site location is shown in Figure 1 – Site Location Map.

A Phase I ESA was completed by Mill Creek Environmental, LLC on March 4, 2016. Based on the Phase I ESA, the property has been developed since the early 1950’s. Property uses have included a residential dwelling or commercial building, an automotive salvage/repair yard, a construction yard, and most recently, energy services for oil and gas companies.

During completion of the Phase I ESA, the following recognized environmental conditions (RECs) were identified:

- The Site was previously used as an automotive salvage and/or repair facility from the 1960s to the 1980s;
- An approximately 500-gallon used oil aboveground storage tank (AST) with soil staining and pooled liquids was observed in a containment area located immediately outside of the shop building on the south side;
- A fleet fueling area with three ASTs with soil staining and pooled liquids was observed within a concrete containment area on the western portion of the property;
- Two approximately 300-gallon used oil ASTs with soil staining were observed immediately outside the shop building on the east side;
- Two vehicle wash areas that discharge wash water directly to the ground were observed;
- An in-ground service pit was observed in the shop building; and
- Containers and drums of potentially hazardous chemicals and petroleum products were observed with no containment, cover or labeling.

The objective of this Limited Phase II ESA was to assess the potential presence of chemicals of concern in soil and groundwater that may be related to the RECs that were identified during the Phase I ESA.

1.2 SCOPE OF SERVICES

A proposal dated December 15, 2016 was prepared and included a scope of work describing the Limited Phase II Environmental Assessment project. The proposal including the scope of work was approved by Reich Brothers on December 15, 2016 and included the following elements:

- Prepare for field activities including development of a site-specific health and safety plan, identification of underground utility locations, and scheduling,
- Complete three soil borings to a depth of four feet below ground surface (bgs) in areas of visible soil staining,
- Collect up to 2 soil samples from each borehole based on field observations and field screening measurements (photoionization detector),
- Install four additional borings to a maximum total depth of 18 feet bgs, collect one soil sample from each of these borings, and convert into one-inch diameter temporary monitoring wells for the collection of groundwater samples to assess potential impacts to groundwater, and
- Preparation of a report documenting the results of the assessment activities.

1.3 LIMITATIONS

This work was performed in a manner consistent with that level of care and skill ordinarily exercised by other members of Kleinfelder's profession practicing in the same locality, under similar conditions and at the date the services are provided. The conclusions, opinions, and recommendations are based on a limited number of observations and data. It is possible that conditions could vary between or beyond the data evaluated. Kleinfelder makes no guarantee or warranty, express or implied, regarding the services, communication (oral or written), report, opinion, or instrument of service provided.

The scope of work for this project was based on a Phase I ESA report completed by Mill Creek Environmental, LLC dated March 2016, which was provided by Reich Brothers. According to the

guidelines of ASTM Designation E 1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*, a Phase I ESA is presumed to be valid for a period of up to 180 days after the completion of the Phase I ESA. Since the Phase I ESA on which the scope of work for this project was based is more than 180 days old, additional environmental concerns may be present at the Site that were not documented in the Phase I ESA. Additionally, Kleinfelder did not conduct the Phase I ESA and therefore cannot assess if all RECs were identified. Kleinfelder is not responsible for conducting assessment activities related to any such concerns that were not documented in the March 2016 Phase I ESA report.

2 ASSESSMENT ACTIVITIES AND RESULTS

The field assessment activities were completed at the Site on December 20, 2016. Prior to any drilling activities, utility locating services including the Texas Excavation Safety System (Texas811) were employed to identify any underground utility lines in the area of the assessment. A site-specific Health and Safety Plan (HASP) was prepared to describe procedures to be followed by our staff while on site. The HASP was reviewed on-site prior to beginning field activities.

2.1 ASSESSMENT PROCEDURES

On December 20, 2016, Kleinfelder mobilized to the site to install the soil borings/temporary monitoring wells and conduct soil and groundwater sampling. Envirotech Drilling Services, LLC (Envirotech), a State of Texas-licensed water well driller, provided drilling services, using a direct push drill rig.

2.1.1 Assessment Methodology

A total of seven soil borings were completed at the locations shown in Figure 2 – Sample Location Map. While drilling the soil borings, continuous soil cores were obtained, described, and logged under the supervision of a Kleinfelder geologist using the Unified Soil Classification System (USCS) in accordance with ASTM D2488. Soil samples were collected at two foot or smaller intervals based on the lithologic changes from ground surface to total depth, and were field screened for organic vapors using a portable PID and head-space screening technique. No organic vapors were detected in any of the borings by the field screening. Soil boring logs are provided in Appendix A.

Three soil borings (SB-1, SB-2, and SB-3) were drilled to a depth of four feet below ground surface (bgs) in areas of soil staining. Two soil samples were collected for laboratory analysis from each of these borings with one sample collected from within the uppermost two feet just below any gravel that was present and the other sample collected from a depth of approximately four feet below ground surface (bgs).

Four additional soil borings (TMW-1, TMW-2, TMW-3, and TMW-4) were drilled to depths of 18 to 20 feet bgs and were converted to temporary monitoring wells. The temporary monitoring wells were located on the southern side of features that were identified as potential sources of contaminants, which is expected to be the downgradient direction based on the topography of the site area and the regional direction of groundwater flow. One soil sample was collected from each of the borings TMW-1, TMW-2, TMW-3, and TMW-4 at the interval above the saturated zone.

Groundwater was encountered in TMW-1, TMW-2, TMW-3, and TMW-4 at depths ranging from approximately 13 to 16 feet bgs. These soil borings were converted into temporary monitoring wells to facilitate collection of groundwater samples. The temporary monitoring wells were constructed of one-inch diameter Schedule 40 PVC casing and well screen (0.01-inch slot). Screened intervals were selected based on observed subsurface conditions. Each temporary monitoring well was developed by pumping of the groundwater to remove sediment. A groundwater sample was collected from each temporary monitoring well using a pump.

Sampling equipment was decontaminated prior to use at each sample location to prevent cross contamination. The samples were placed into clean, laboratory-provided containers and immediately placed on ice in a chilled cooler for transport to ALS Environmental (ALS), a National Environmental Laboratory Accreditation Conference (NELAC) accredited laboratory in Houston, Texas for analysis.

Upon completion of sample collection, each temporary monitoring well was removed, and all of the borings were backfilled with hydrated bentonite.

2.1.2 Site Geology

The Site topographic gradient slopes gently to the southwest with an elevation of approximately 14 feet above mean sea level (MSL). The Site is underlain by the Quaternary Beaumont Formation which in this region is dominantly deltaic sands and clay. The clays typically have high-water holding capacity, high compressibility, and high to very high shrink-swell potential.

Based on observations made during the drilling activities, the undisturbed shallow subsurface lithology is composed mostly of a brown to gray, firm clay. Underlying the clay at depths ranging

from approximately 13 to 15 feet bgs, the lithology is sandier and is composed of sand and sandy clay.

During drilling activities, no odors were noted and no organic vapors were detected using the PID. Boring logs are included in Appendix A.

2.2 SOIL ASSESSMENT

2.2.1 Soil Analytical Methods and Standards

Soil samples were submitted to ALS Environmental in Houston, Texas for analysis of total petroleum hydrocarbons (TPH) using Texas Method TX1005; benzene, toluene, ethylbenzene and xylenes (BTEX) using EPA Method 8021B; and RCRA 8 metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) using EPA Methods 6020A/7471A.

2.2.2 Soil Analytical Results

The analyte concentrations detected in soil samples were initially compared to Tier I Residential Protective Concentration Levels (PCLs) established by the Texas Commission on Environmental Quality (TCEQ) for direct exposure of individuals to chemicals in the soil, designated as ${}^{\text{Tot}}\text{Soil}_{\text{Comb}}$ PCLs. The concentrations were also compared to PCLs established to assess leaching of chemicals into groundwater at unsafe levels for drinking, designated as ${}^{\text{GW}}\text{Soil}_{\text{ing}}$ PCLs. Concentrations of metals were also compared to Texas-Specific Median Background Concentrations, which have been established by the TCEQ. Laboratory analytical results for the soil samples are summarized in Tables 1 and 2 and a copy of the laboratory analytical report is included in Appendix B. Following receipt of the final analytical laboratory report, Kleinfelder validated the usability of the soil data. The data validation checklist is included with the laboratory report in Appendix B. The laboratory data for the soil and groundwater samples are usable for the purposes of this report.

Based on the analytical results, TPH and BTEX were not detected at concentrations greater than the laboratory reporting limits in any of the soil samples.

Metals were detected in all of the soil samples. Since metals are known to be present naturally in soil, the detected metals concentrations were compared to the Texas-Specific Median Background Concentrations as well as the PCLs. Lead was detected at a concentration of 145 milligrams per kilogram (mg/kg) in the soil sample from the uppermost two feet in SB-3, which was located in the area of an apparent vehicle washing area on the east-central portion of the Site. This concentration is greater than both the established background concentration (15 mg/kg) and the PCL for leaching to groundwater at unsafe concentrations (3 mg/kg). The lead concentration detected in a soil sample collected from a depth of approximately four feet bgs in SB-3 did not exceed the established background concentration. No other metals concentrations detected in any of the soil samples exceeded both the PCLs and the established background concentrations.

2.3 GROUNDWATER ASSESSMENT

2.3.1 Site Hydrogeology

Saturated soil conditions were encountered during this investigation at depths ranging from approximately 13 to 16 feet bgs. In all four temporary monitoring wells, sand intervals underlying the site-wide clay were observed to be wet and yielded water. Based on the surface topography of the site area and the regional direction of groundwater flow, the general direction of groundwater flow is expected to be to the south.

2.3.2 Groundwater Analytical Methods

Groundwater samples were submitted to ALS Environmental in Houston, Texas for analysis of volatile organic compounds (VOCs) using EPA Method 8260C and TPH using Texas Method TX1005. A total of four groundwater sample samples were collected and analyzed

2.2.3 Groundwater Analytical Results

The analytical results for VOCs and TPH were compared to Tier 1 Residential ^{GW}GW_{Ing} PCLs established by the TCEQ to be protective of a Class 1 groundwater resource.

Laboratory analytical results of the groundwater samples are summarized in Table 3. Following receipt of the final analytical laboratory report, Kleinfelder validated the usability of the groundwater data. The data validation checklist is included with the laboratory report in Appendix B.

Based on the analytical results, TPH was not detected at concentrations greater than the laboratory reporting limits in any of the groundwater samples.

The following concentrations of VOCs were detected in groundwater samples:

- Carbon disulfide in TMW-1,
- 1,1-Dichloroethene (DCE) in TMW-1 and TMW-4,
- Ethylbenzene in TMW-3
- Methyl tertiary butyl ether (MTBE) in TMW-1, TMW-2 and TMW-3, and
- 1,1-Dichloroethane (DCA) in TMW-4.

All of these VOC concentrations were less than the PCLs except for the DCE concentration of 0.015 mg/L in TMW-4, which is greater than the PCL of 0.007 mg/L.

2.3 INVESTIGATION-DERIVED WASTE

No investigation-derived waste (IDW) was generated during this assessment that required characterization or removal for off-site disposal.

3 SUMMARY AND CONCLUSIONS

3.1 SUMMARY

A Limited Phase II Environmental Site Assessment (ESA) was conducted at the former EMS Beaumont Facility (Site) located at 17691 State Highway 124, Beaumont, Jefferson County, Texas as requested by Reich Brothers Holdings, LLC (Reich Brothers, the "Client") to further assess recognized environmental conditions (RECs) at the Site. The subject property comprises approximately 7.27 acres of land and is surrounded by residential properties. The RECs were identified in a Phase I ESA completed by Mill Creek Environmental, LLC on March 4, 2016. Selected site photographs taken on December 20, 2016 are included in Appendix C.

Three soil borings (SB-1, SB-2, and SB-3) were drilled to a depth of four feet below ground surface (bgs) in areas of that were reported to have had soil staining. Two soil samples were collected for laboratory analysis from each of these borings with one sample collected from within the uppermost two feet just below any gravel that was present and the other sample collected from a depth of approximately four feet below ground surface (bgs).

Four additional soil borings (TMW-1, TMW-2, TMW-3, and TMW-4) were drilled to depths of 18 to 20 feet bgs and were converted to temporary monitoring wells. The temporary monitoring wells were located on the southern side of features that were identified as potential sources of contaminants, which is expected to be the downgradient direction based on the topography of the site area and the regional direction of groundwater flow. One soil sample was collected from each of the borings TMW-1, TMW-2, TMW-3, and TMW-4 at the interval above the saturated zone. These soil borings were converted into temporary monitoring wells and groundwater samples were collected from each of the temporary monitoring wells.

Soil samples were analyzed for total petroleum hydrocarbons (TPH) using Texas Method TX1005; benzene, toluene, ethylbenzene and xylenes (BTEX) using EPA Method 8021B; and RCRA 8 metals using EPA Methods 6020A/7471A. A total of ten soil samples were collected and analyzed. Groundwater samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8260C and TPH using Texas Method TX1005. A total of four groundwater sample samples were collected and analyzed

Based on the analytical results, TPH and BTEX were not detected at concentrations greater than the laboratory reporting limits in any of the soil samples. Metals were detected in all of the soil samples. Lead was detected at a concentration of 145 milligrams per kilogram (mg/kg) in the soil sample from the uppermost two feet in SB-3, which was located in the area of an apparent vehicle washing area on the east-central portion of the Site. This concentration is greater than both the established background concentration (15 mg/kg) and the PCL for leaching to groundwater at unsafe concentrations (3 mg/kg). The lead concentration detected in a soil sample collected from a depth of approximately four feet bgs in SB-3 was 9.85 mg/kg, which did not exceed the established background concentration. No other metals concentrations detected in any of the soil samples exceeded both the PCLs and the established background concentrations.

Based on the analytical results for groundwater samples, TPH was not detected at concentrations greater than the laboratory reporting limits in any of the groundwater samples. Ethylbenzene was detected in the groundwater sample from TMW-3 at an estimated concentration of 0.00079 milligrams per liter (mg/L), which is less than the PCL of 0.7 mg/L. Four additional VOCs, including MTBE, were detected in one or more groundwater samples. MTBE is a common gasoline additive and ethylbenzene is often associated with fuel releases. All of these VOC concentrations were less than the PCLs except for the DCE concentration of 0.015 mg/L in TMW-4, which is greater than the PCL of 0.007 mg/L. DCE is present in chlorinated solvents that are commonly used at industrial facilities.

3.2 CONCLUSIONS

Based on the results of the Limited Phase II ESA summarized above, the following conclusions are presented:

- Lead was detected in a soil sample from the uppermost two feet in soil boring SB-3 at a concentration greater than the Texas-Specific Median Background Concentration and the PCL established by the TCEQ. . The lead concentration detected in a soil sample from approximately four feet bgs in SB-3 was less than the background concentration and the PCL, suggesting that the soil with elevated lead concentrations is limited to the uppermost two to four feet.
- Methyl tertiary butyl ether (MTBE) was detected in groundwater samples from three monitoring wells and ethylbenzene was detected in one groundwater sample. All of the

concentrations were less than the PCLs established by the TCEQ. A release of gasoline may have occurred at the Site, but no concentrations were detected during this limited Phase II ESA that indicate a release that would require investigation and possible corrective action, in accordance with the regulations of the TCEQ.

- 1,1-Dichloroethene (DCE) was detected in the groundwater sample from TMW-4 at a concentration of 0.015 mg/L, which is greater than the PCL of 0.007 mg/L. TMW-4 is located in the area of a former vehicle wash station and a former storage building on the central portion of the Site. The concentration detected in the groundwater sample from TMW-4 is indicative of a release that would require investigation and possible corrective action, in accordance with the regulations of the TCEQ.

BORING LOG TMW-4

TMW-4

APPENDIX B

LABORATORY REPORT

Project: Reich Brothers Holdings, LLC. EMS BMT		Reviewer: K. Scheller		Review Date: 1-3-17
Laboratory: ALS Environmental, Houston Work Order No.: HS16121088		Analytical Methods: VOCs by 8260; TPH by TX1005; BTEX by 8021B; 7 metals by 6020; Hg by 7471A		Matrices: 10 Soil and 4 Groundwater (TMW) samples
#	Review Item or Question		Yes	No
Sample Preservation and Integrity				
1	Did samples arrive at the laboratory appropriately preserved (e.g., 4°C, correct acid added to sample)?	X		1.8 and 1.4 Celcius
2	Were holding times met?	X		
Data Completeness				
3	Are results reported for all target analytes, with no additional analytes?	X		
4	Was the requested analytical method followed?	X		
5	Do reported detection limits (or reporting limits/MDLs) agree with the project specifications (QAPP)?	X		
6	Are results reported for all samples submitted for analysis?	X		
Calibration and QC Sample Frequency				
7	Were initial and continuing instrument calibration analyses performed? And reported? ^a			Not reported.
8	For each analytical batch, are results provided for a method blank?	X		
9	For each analytical batch, are results provided for an LCS/LCSD pair?	X		LCS only (no LCSD) for VOCs, BTEX and 8 metals
10	For each analytical/preparation batch, are results provided for an MS/MSD pair? Alternately, are results for MS/MSD pairs provided for every 20 field samples analyzed?	X		Project samples: TMW-1-1216 for TPH and 7 6020 metals; TMW-2-1216 for TPH
11	Are field duplicate results provided at the project-specified (QAPP) frequency?			No field duplicates were submitted to lab.
12	Organic Analyses Only: For each sample (field and QC), are surrogate spike results provided?	X		

Project: Reich Brothers Holdings, LLC. EMS BMT		Reviewer: K. Scheller		Review Date: 1-3-17
Laboratory: ALS Environmental, Houston Work Order No.: HS16121088		Analytical Methods: VOCs by 8260; TPH by TX1005; BTEX by 8021B; 7 metals by 6020; Hg by 7471A		Matrices: 10 Soil and 4 Groundwater (TMW) samples
#	Review Item or Question	Yes	No	Comments
QC Results				
13	Do method blank (MB) results show no detectable concentrations of target analytes (<i>i.e.</i> , results = ND)?		X	Hg (mercury) in soil MB. All Hg soil results >5x MB. No qualifiers applied.
14	Are LCS/LCSD recoveries and RPDs within limits?	X		
15	Are MS/MSD recoveries and RPDs within limits?	X		Applicable only when project samples used
16	Are surrogate recoveries within limits (organic analyses only)?	X		
Other Data Quality-Related Issues				
17	The laboratory did not issue any CARs. If this is not true (a CAR was issued), describe impact on sample results.	X		The lab did not issue a CAR.
18	The analyst did not describe any analytical anomalies. If this is not true, describe potential impact to sample results.	X		
19	No other potential data quality issues were identified. If this is not true, describe issues.		X	Cyclohexane is not offered for accreditation by TCEQ and sample results are estimated.

^a The laboratory will not be required to report all calibration results. Data validation efforts for this project will assume that the laboratory performed the method-specified calibration analyses.

CAR = Corrective Action Report QAPP = Quality Assurance Project Plan

LCS/LCSD = Laboratory Control Sample/Duplicate Laboratory Control Sample

MS/MSD = Matrix Spike/Matrix Spike Duplicate

RPD = Relative Percent Difference MB – analytical method blank

Notes:

Based on this data quality assessment effort, no data validation qualifiers have been applied. Cyclohexane is not offered for accreditation by the TCEQ and each groundwater cyclohexane result is considered to be an estimated result. The lab applied a “J” flag (for estimated result) when analytes were reported between the sample detection limit (SDL) and method quantitation limit (MQL). These estimated “J” flag results are retained.

Suite 450
Houston, TX 77034

Work Order: **HS16121088**

Laboratory Results for: **EMS BMT Facility**

Dear Albano,

ALS Environmental received 14 sample(s) on Dec 21, 2016 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

A handwritten signature in black ink that reads "Sonia West".

CASE NARRATIVE**Work Order Comments**

- The soil sample containers for TPH by method TX1005 were received with ~5 grams (1 plug) in each vial.

GC Semivolatiles by Method TX1005**Batch ID: 110983**

Sample ID: **HS16120718-01MS**
• MS and MSD are for an unrelated sample

Batch ID: 111004,111039

- The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

GC Volatiles by Method SW8021B**Batch ID: R287176**

- The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

GCMS Volatiles by Method SW8260**Batch ID: R287361**

Sample ID: **HS16121264-02MS**
• MS and MSD are for an unrelated sample

Metals by Method SW7471A**Batch ID: 111054**

- The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

Metals by Method SW6020**Batch ID: 111040**

- The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

WetChemistry by Method SW3550**Batch ID: R287250**

- The test results meet requirements of the current NELAP standards, state requirements or programs where applicable.

The following samples were analyzed in this batch:

HS16121088-01	HS16121088-02	HS16121088-03	HS16121088-04
HS16121088-05	HS16121088-06	HS16121088-07	HS16121088-08
HS16121088-09	HS16121088-10		

Note: See Qualifiers Page for a list of qualifiers and their explanation.

Client: Kleinfelder
Project: EMS BMT Facility
WorkOrder: HS16121088

**QUALIFIERS,
ACRONYMS, UNITS**

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
UG/L	Micrograms per Liter
